

Answer to Question #61776, Chemistry / Other

Carry out the necessary calculations in order to administer the required number of tablets to a patient with an order for 60 mg of a drug that is available in 30-mg tablets. How many tablets should you administer?

Multiple Choice

2 tablets

1.5 tablets

1 tablet

0.5 tablet

Answer:

$$n = \frac{60 \text{ mg}}{30 \text{ mg}} = 2$$

2 tablets!
