

Answer on Question #64937 – Chemistry – General Chemistry

Calculate the equilibrium concentrations of the dissociated species of acetic acid (CH_3COOH) in a 0.01 molar solution of acetic acid. Acetic acid is a weak acid its dissociation equilibrium constant at 25 degrees Celsius and 1 bar is $10^{-4.75}$. What is the pH equilibrium? What is degree of dissociation at equilibrium? %dissociation of an acid = $100 \times (\text{amount of acid dissociated} / \text{amount of acid originally present})$.

Solution.

$$K_a(\text{CH}_3\text{COOH}) = 10^{-4.75} = 1.78 \times 10^{-5}$$

$$K_a = \frac{[\text{H}^+][\text{A}^-]}{[\text{HA}]} = \frac{[\text{H}^+][\text{CH}_3\text{COO}^-]}{[\text{CH}_3\text{COOH}]}$$

$$K_a = x \cdot x / (0.01 - x) \approx x^2 / 0.01 = 1.78 \times 10^{-5}$$

$$x = \sqrt{1.78 \times 10^{-5} \times 0.01} = 0.42 \times 10^{-3} = 4.2 \times 10^{-4} \text{ M}$$

$$[\text{H}^+] = [\text{CH}_3\text{COO}^-] = 4.2 \times 10^{-4} \text{ M}$$

$$[\text{CH}_3\text{COOH}] = 0.01 \text{ M}$$

$$\text{pH} = -\log [\text{H}^+] = -\log (4.2 \times 10^{-4}) = 3.38$$

$$\alpha = [\text{H}^+] / [\text{HA}] = [\text{H}^+] / [\text{CH}_3\text{COOH}] \times 100 \% = 4.2 \times 10^{-4} / 0.01 \times 100 \% = 4.2 \%$$

Answer: $[\text{H}^+] = [\text{CH}_3\text{COO}^-] = 4.2 \times 10^{-4} \text{ M}$; $[\text{CH}_3\text{COOH}] = 0.01 \text{ M}$

$$\text{pH} = 3.38$$

$$\alpha = 4.2 \%$$
