

### Answer on Question #66939, Chemistry / General Chemistry

The rate constant for the equation  $2 \text{C}_2\text{F}_4 \rightarrow \text{C}_4\text{F}_8$  is  $0.0488 \text{ M}^{-1} \text{ s}^{-1}$ . We start with  $0.166 \text{ mol C}_2\text{F}_4$  in a  $5.00\text{-liter}$  container, with no  $\text{C}_4\text{F}_8$  initially present. What will be the concentration of  $\text{C}_2\text{F}_4$  after  $2.00$  hours? Answer in units of  $\text{M}$ .

#### Solution:

$$-d[\text{A}] / dt = k \times [\text{A}]^2$$

$$(1 / [\text{A}]^2) d[\text{A}] = -k \times dt$$

$$\int (1 / [\text{A}]^2) d[\text{A}] = \int -k dt$$

$$-1/[\text{A}] + 1 / [\text{A}_0] = -k \Delta t$$

$$1 / [\text{A}] = 1 / [\text{A}_0] + k \Delta t$$

$$1 / [\text{A}] = 1 / (0.166 \text{ moles} / 5.00\text{L}) + (0.0488 \text{ M}^{-1} \text{ s}^{-1}) \times (7200 \text{ s})$$

$$1 / [\text{A}] = 381.5 / \text{M}$$

$$[\text{A}] = 0.00262 \text{ M}$$

**Answer: 0.00262 M**
