

## Answer on the question #69582, Chemistry / Physical Chemistry

### Question:

One mole of an ideal gas with  $C_p = (7/2) R$  and  $C_v = (5/2) R$  expands from  $P_1 = 8 \text{ bar}$  &  $T_1 = 600 \text{ K}$  to  $P_2 = 1 \text{ bar}$  by each of the following paths?

(1) Constant volume. (2) Constant temperature. (3) Adiabatically. Assuming mechanical reversibility calculate  $W$ ,  $Q$ ,  $\Delta U$  and  $\Delta H$  for each process

### Solution:

1) Constant volume process :

$$W = - \int_{V_1}^{V_2} p dV = 0$$
$$Q = \int_{T_1}^{T_2} C_v dT = C_v (T_2 - T_1)$$

Let's find the final temperature :

$$\frac{p_1}{T_1} = \frac{p_2}{T_2}$$

$$T_2 = \frac{p_2 \cdot T_1}{p_1} = \frac{1 \text{ bar} \cdot 600 \text{ K}}{8 \text{ bar}} = 75 \text{ K}$$

Thus, heat is :

$$Q = \frac{5}{2} \cdot 8.314 \cdot (75 - 600) = -10.91 \text{ kJ}$$

Change in internal energy is :

$$\Delta U = Q + W = -10.91 \text{ kJ}$$

Change in enthalpy of ideal gas at constant volume is:

$$\Delta H = Q + V \Delta P = -10.91 \text{ kJ} + \frac{RT_1}{P_1} (P_2 - P_1)$$
$$= -10.91 \text{ kJ} + \frac{8.314 \text{ J/K} \cdot 600 \text{ K}}{8 \text{ bar}} (1 \text{ bar} - 8 \text{ bar})$$
$$= -10.91 \text{ kJ} - 4.36 \text{ kJ} = -15.27 \text{ kJ}$$

2) Constant temperature process :

Work done in the process :

$$W = - \int_{V_1}^{V_2} p dV = nRT \ln \frac{p_2}{p_1} = 8.314 \frac{\text{J}}{\text{K}} \cdot 600 \text{ K} \cdot \ln \left( \frac{1}{8} \right) = -10.37 \text{ kJ}$$

As for ideal gas, it's internal energy change and enthalpy change are zero as the temperature is constant :

$$\Delta U = \Delta H = 0$$

Then, heat change is :

$$Q = \Delta U - W = 10.37 \text{ kJ}$$

3) Adiabatic process :

Change in heat is zero :

$$Q = 0$$

Thus, internal energy is equal to work :

$$\Delta U = W = \int_{V_1}^{V_2} P dV = \frac{nR}{\gamma - 1} (T_2 - T_1)$$

where  $\gamma = \frac{c_p}{c_v} = \frac{7}{5} = 1.4$ .

Let's find the final temperature :

$$T_2 = T_1 \left( \frac{P_2}{P_1} \right)^{\frac{\gamma-1}{\gamma}} = 331.2 \text{ K}$$

$$\Delta U = W = \frac{8.314 \text{ J/K}}{1.4 - 1} (331.2 \text{ K} - 600 \text{ K}) = -5.59 \text{ kJ}$$

Enthalpy of the process is :

$$\Delta H = nC_p \Delta T = \frac{7}{2} \cdot \frac{8.314 \text{ J}}{\text{K}} \cdot (331.2 \text{ K} - 600 \text{ K}) = -7.82 \text{ kJ}$$

**Answer :**

(1) 0 ; -10.91 kJ ; -10.91 kJ ; -15.27 kJ

(2) -10.37 kJ ; 10.37 kJ ; 0 ; 0

(3) -5.59 kJ ; 0 ; -5.59 kJ ; -7.82 kJ
