

Answer on Question #72994 - Chemistry - Physical Chemistry

Question:

Question 12 : A container with volume 71.9 ml contains water vapor at a pressure of 10.4 atm and a temperature of 465°C. How many grams of the gas are in the container?

0.183 g

0.222 g

0.129 g

0.421 g

Solution:

Ideal gas law can be used to establish the link between the mass of the gas m , its volume V , temperature T and pressure p through the molar mass $M = 18.01528 \cdot 10^{-3} (\text{kg mol}^{-1})$:

$$pV = nRT \Rightarrow pV = \frac{m}{M}RT,$$

where n is the number of the moles of the gas and R is the ideal gas constant, $8.314 (\text{J mol}^{-1} \text{K}^{-1})$.

$$m = \frac{pVM}{RT},$$

$$m = \frac{10.4 \cdot 101325 (\text{Pa}) \cdot 71.9 \cdot 10^{-6} (\text{m}^3) \cdot 18.01528 \cdot 10^{-3} (\text{kg mol}^{-1})}{8.314 (\text{J mol}^{-1} \text{K}^{-1}) \cdot (465 + 273.15) (\text{K})}$$

$$m = 2.22 \cdot 10^{-4} \text{ kg} = 0.222 \text{ g}$$

Answer: 0.222 g
