

Scientific notation. A representative eight-atom piece of crystalline silicon is a cube. The length of an edge of the cube is 545 pm. Note: $1 \text{ pm} \equiv 10^{-12} \text{ m}$. The mass of one silicon atom is $4.66 \times 10^{-26} \text{ kg}$. A cube contains eight atoms.

Calculate the volume of the cube. Using scientific notation, write the volume in units of m^3 .

Write the mass of the cube in kg. Use scientific notation.

From your answers to parts a and b, calculate the density of crystalline silicon. Give the density in kg/m^3 .

Convert density from kg/m^3 to g/cm^3 . Note that $1 \text{ kg} \equiv 1000 \text{ g}$ and $1 \text{ m}^3 = 10^6 \text{ cm}^3$.

Solution:

$$1. V(\text{cube}) = a^3$$

$$a = 545 \text{ pm} = 545 \times 10^{-12} \text{ m};$$

$$V(\text{cube}) = (545 \times 10^{-12})^3 = 545^3 \times 10^{-36} = 161878625 \times 10^{-36} = 0.162 \times 10^{-27} \text{ m}^3$$

$$2. m(\text{Si}) = n \times m(\text{one Si atom}) = 8 \times 4.66 \times 10^{-26} = 37.28 \times 10^{-26} \text{ kg}$$

$$3. \rho = \frac{m}{V};$$

$$\rho(\text{Si}) = \frac{37.28 \times 10^{-26}}{0.162 \times 10^{-27}} = 2301 \frac{\text{kg}}{\text{m}^3};$$

$$4. 2301 \frac{\text{kg}}{\text{m}^3} = \frac{2301 \times 1000}{10^6} = 2235.87 \frac{\text{g}}{\text{cm}^3}.$$

$$\text{Answer: } V(\text{cube}) = 0.162 \times 10^{-27} \text{ m}^3; m(\text{Si}) = 37.28 \times 10^{-26} \text{ kg}; \rho(\text{Si}) = 2301 \frac{\text{kg}}{\text{m}^3} = 2235.87 \frac{\text{g}}{\text{cm}^3}$$
