

Answer on Question #49456 – Math– Multivariable Calculus

Question:

Sketch the region of integration for the integral

$$\int_0^2 \int_{x^2}^{2x} (4x + 2) dx dy \quad (1)$$

and write an equivalent integral with the order of integration reversed. Hence, evaluate the integral.

Solution:

1) Suppose that the the region of integration D is defined by $x_1 \leq x \leq x_2$ and $y_1(x) \leq y \leq y_2(x)$ (the vertically simple region). The double integral is given by

$$\iint_{(D)} f(x, y) dx dy = \int_{x_1}^{x_2} \left(\int_{y_1(x)}^{y_2(x)} f(x, y) dy \right) dx \quad (2)$$

and is computed as iterated integral.

2) If the region D is defined by $y_1 \leq y \leq y_2$ and $x_1(y) \leq x \leq x_2(y)$ (the horizontally simple region), then the double integral is given by

$$\iint_{(D)} f(x, y) dx dy = \int_{y_1}^{y_2} \left(\int_{x_1(y)}^{x_2(y)} f(x, y) dx \right) dy \quad , \quad (3)$$

and also is evaluated as iterated integral.

In our case the region D is bounded by the curves $y(x)=x^2$ and $y(x)=2x$ (see fig.1)

Fig.1

In the original integral, the integration order is $dydx$ (this order corresponds to integrating first with respect to y). So, to compute (1) we can use the form (2) assuming that $0 \leq x \leq 2$ and $x^2 \leq y \leq 2x$:

$$\begin{aligned}
\int_0^2 \left(\int_{x^2}^{2x} (4x + 2) dy \right) dx &= \int_0^2 \left((4xy + 2y) \Big|_{x^2}^{2x} \right) dx = \int_0^2 \left((4x \cdot 2x + 2 \cdot 2x - (4x \cdot x^2 + 2 \cdot x^2)) \right) dx \\
&= \int_0^2 (8x^2 + 4x - (4x^3 + 2x^2)) dx = \int_0^2 (6x^2 + 4x - 4x^3) dx = \left(6 \frac{x^3}{3} + 4 \frac{x^2}{2} - 4 \frac{x^4}{4} \right) \Big|_0^2 \\
&= (2^4 + 2^3 - 2^4) = 8
\end{aligned}$$

Now let us change the order of integration in (1) to be $dx dy$. For this we transform the limits of integration into the domain D . The order $dx dy$ means that y is the variable of the outer integral and its limits must be constant. So for variable y (see fig.1) we have $0 \leq y \leq 4$. As x will be the variable for the inner integration, we need to integrate with respect to x first. We can rewrite the equations $y(x)=x^2$ and $y(x)=2x$ as $x(y) = \sqrt{y}$ and $x(y) = \frac{y}{2}$ respectively. Hence, the range of x is $\frac{y}{2} \leq x \leq \sqrt{y}$. Therefore, the integral (1) with the reversed order of integration takes the form (3), where region D is described by pair of inequalities $0 \leq y \leq 4$ and $\sqrt{y} \leq x \leq \frac{y}{2}$. Let us evaluate it.

$$\begin{aligned}
\int_0^4 \left(\int_{\frac{y}{2}}^{\sqrt{y}} (4x + 2) dx \right) dy &= \int_0^4 \left(\left(4 \frac{x^2}{2} + 2x \right) \Big|_{\frac{y}{2}}^{\sqrt{y}} \right) dy = \int_0^4 \left(2(\sqrt{y})^2 + 2 \cdot \sqrt{y} - 2 \left(\frac{y}{2} \right)^2 - 2 \cdot \frac{y}{2} \right) dy \\
&= \int_0^4 \left(y + 2 \cdot \sqrt{y} - \frac{y^2}{2} \right) dy = \left(\frac{y^2}{2} + 2 \cdot \frac{2}{3} \sqrt{y^3} - \frac{y^3}{6} \right) \Big|_0^4 = \left(\frac{4^2}{2} + 2 \cdot \frac{2}{3} \sqrt{4^3} - \frac{4^3}{6} \right) \\
&= \left(8 + \frac{2^6}{6} - \frac{2^6}{6} \right) = 8.
\end{aligned}$$

As it must, these iterated integrals give the same answer.

Answer: $\int_0^2 \left(\int_{x^2}^{2x} (4x + 2) dy \right) dx = \int_0^4 \left(\int_{\frac{y}{2}}^{\sqrt{y}} (4x + 2) dx \right) dy = 8.$
