

### **Answer on Question #49783-Math-Statistics and Probability**

How do you turn grouped frequency tables into raw data?

#### **Solution**

We can't turn grouped frequency tables into raw data! In a grouped frequency distribution, similar values are combined into groups and the frequencies of each value in a group are added to provide a frequency for that group. However, because you are grouping numbers and adding frequencies of values within groups together, there is a loss of information (i.e., you cannot know the frequency of a specific value).
