

Answer on Question #50469 – Math – Calculus

The maximum value of $[x(x-1) + 1]^{1/3}$, $0 \leq x \leq 1$ is ?

Solution

Function $f(x) = \frac{1}{3}(x(x-1) + 1)$ is continuous on the segment $[0; 1]$ and differentiable at all points of this segment except, possibly, finitely many points. Then the largest and the smallest values of $f(x)$ on $[0; 1]$ belong to the set consisting of $f(0)$, $f(1)$, and the values $f(x_i)$, where $x_i \in (0; 1)$ are the points at which $f'(x)$ is either equal to zero or does not exist (is infinite).

$$\text{Evaluate } f(0) = \frac{1}{3}(0(0-1) + 1) = \frac{1}{3}(0+1) = \frac{1}{3},$$

$$f(1) = \frac{1}{3}(1(1-1) + 1) = \frac{1}{3}(0+1) = \frac{1}{3}, \text{ i.e. } f(0) = f(1) = \frac{1}{3}.$$

$$\begin{aligned} f'(x) &= \left(\frac{1}{3}(x(x-1) + 1) \right)' = |\text{additive property}| = \frac{1}{3}(x(x-1))' + \frac{1}{3}(1)' = \frac{1}{3}(x(x-1))' + 0 \\ &= \frac{1}{3}(x(x-1))' = |\text{the derivative of the product}| = \frac{1}{3}(x)'(x-1) + \frac{1}{3}x(x-1)' \\ &= \frac{1}{3}(x-1) + \frac{1}{3}x = \frac{2}{3}x - \frac{1}{3} = \frac{2x-1}{3} = 0, \end{aligned}$$

$$\text{hence } 2x - 1 = 0, \text{ so } x = \frac{1}{2}.$$

$$\text{Calculate } f\left(\frac{1}{2}\right) = \frac{1}{3}\left(\frac{1}{2}\left(\frac{1}{2}-1\right) + 1\right) = \frac{1}{3}\left(-\frac{1}{2} \cdot \frac{1}{2} + 1\right) = \frac{1}{3}\left(-\frac{1}{4} + 1\right) = \frac{1}{3} \cdot \frac{3}{4} = \frac{1}{4} < \frac{1}{3}.$$

Thus, the maximum of $\frac{1}{4}$ and $\frac{1}{3}$ is $\frac{1}{3}$, that is why the maximum value of $f(x) = \frac{1}{3}(x(x-1) + 1)$, $0 \leq x \leq 1$, is $\frac{1}{3}$, because $f(0) = f(1) = \frac{1}{3}$.
