

Answer on Question #50588 - Math - Calculus

Question

A rectangle has sides of length x cm and $(2x - 4)$ cm and the length x cm at time t seconds is given by $x = 2 + 3t$, ($t \geq 0$). Show that the area, A cm^2 , the rectangle, in terms of t is $A = 12t + 18t^2$. Hence find the rate of change of the area at the instant when $t = 2$.

Solution

It is known that the area of rectangle with lengths of sides x cm and $(2x - 4)$ cm is

$$A = x(2x - 4) \text{ cm}^2.$$

Since $x(t) = 2 + 3t$, then

$$A(t) = x(t)(2x(t) - 4) = (2 + 3t)(2(2 + 3t) - 4) = (2 + 3t)(4 + 6t - 4) = (2 + 3t)6t = 12t + 18t^2.$$

The rate of changing the area of rectangle is the derivative of $A(t)$ with respect to t :

$$A'(t) = (12t + 18t^2)' = 12 + 36t.$$

Then at moment $t = 2$ it will be $A'(2) = 12 + 36 \cdot 2 = 84 \text{ cm}^2 / \text{s}$.

Answer. $84 \text{ cm}^2 / \text{s}$.
