

**Answer on Question #55855 – Math – Calculus**

Is the given linear expression a factor of the polynomial? Show your work.

13:  $f(x) = 2x^3 + x^2 - 5x + 2$

Yes

14:  $g(x) = 3x^3 + 2x^2 - 17x + 6; x + 3$

No

15:  $h(x) = x^4 - 4x^3 - 15x^2 + 58x - 40; x - 5$

yes

**Solution**

**13.** We have  $f(x) = 2x^3 + x^2 - 5x + 2$ .

$$2x^3 + x^2 - 5x + 2 = 0.$$

A root of the equation will be divisors of 2.

2:  $\pm 1, \pm 2$ . Substitute in polynomial  $f(x)$

$$2 * 1^3 + 1^2 - 5 * 1 + 2 = 0$$

So, 1 is the root of the polynomial.

$$\begin{array}{r}
 2x^3 + x^2 - 5x + 2 \quad | \quad x - 1 \\
 \hline
 - \phantom{2x^3 +} \phantom{x^2 -} \phantom{5x +} \phantom{2} \quad | \quad 2x^2 + 3x - 2 \\
 \hline
 2x^3 - 2x^2 \\
 \hline
 3x^2 - 5x + 2 \\
 - \phantom{3x^2 -} \phantom{5x +} \phantom{2} \\
 \hline
 3x^2 - 3x \\
 \hline
 - 2x + 2 \\
 - \phantom{- 2x +} \phantom{2} \\
 \hline
 -2x + 2 \\
 \hline
 0
 \end{array}$$

because the remainder is 0, 1 really is the root.

$$2x^2 + 3x - 2 = 0 \text{ is a quadratic equation.}$$

Its roots are

$$\begin{aligned}
 x &= \frac{-3 - \sqrt{9 - 4 \cdot 2 \cdot (-2)}}{2 \cdot 2} = \frac{-3 - 5}{4} = \frac{-8}{4} = -2 \text{ and} \\
 x &= \frac{-3 + \sqrt{9 - 4 \cdot 2 \cdot (-2)}}{2 \cdot 2} = \frac{-3 + 5}{4} = \frac{2}{4} = \frac{1}{2}.
 \end{aligned}$$

Then  $x_2 = -2, x_3 = 1/2$ .

Answer:  $x_1 = 1, x_2 = -2, x_3 = 1/2$

14.

$$\begin{array}{r|l} 3x^3 + 2x^2 - 17x + 6 & x + 3 \\ \hline 3x^3 + 9x^2 & \\ \hline -7x^2 - 17x + 6 & \\ -7x^2 - 21x & \\ \hline 4x + 6 & \\ 4x + 12 & \\ \hline -6 & \end{array}$$

So, -3 is not a root.

15.

$$\begin{array}{r|l} x^4 - 4x^3 - 15x^2 + 58x - 40 & x - 5 \\ \hline x^4 - 5x^3 & \\ \hline x^3 - 15x^2 + 58x - 40 & \\ x^3 - 5x^2 & \\ \hline -10x^2 + 58x - 40 & \\ -10x^2 + 50x & \\ \hline 8x - 40 & \\ 8x - 40 & \\ \hline 0 & \end{array}$$

So, 5 is a root.
