

## Answer on Question #57663 – Math – Calculus

Find the Fourier series of  $f(x) = 2 - x^2$  on  $(-2 < x < 2)$

### Solution

Recall that the mathematical expression

$$f(x) \sim a_0 + \sum_{i=1}^{\infty} \left( a_i \cos\left(\frac{\pi}{2}ix\right) + b_i \sin\left(\frac{\pi}{2}ix\right) \right)$$

is called a **Fourier series**. The constants  $a_0$ ,  $a_i$  and  $b_i$  for  $i = 1, 2, 3, \dots$ , are called the **coefficients** of  $F_n(x)$ .

So we need to find these coefficients.

$$\begin{aligned} a_0 &= \frac{1}{2} \int_{-2}^2 f(x) dx = \frac{1}{2} \int_{-2}^2 (2 - x^2) dx = \frac{1}{2} \left( 2x - \frac{x^3}{3} \right) \Big|_{-2}^2 = \frac{4}{3} \\ a_i &= \frac{1}{2} \int_{-2}^2 f(x) \cos\left(\frac{\pi}{2}ix\right) dx \\ &= \frac{1}{2} \int_{-2}^2 (2 - x^2) \cos\left(\frac{\pi}{2}ix\right) dx = \frac{1}{2} \int_{-2}^2 2 \cos\left(\frac{\pi}{2}ix\right) dx \\ &= -\frac{1}{2} \int_{-2}^2 x^2 \cos\left(\frac{\pi}{2}ix\right) dx = 0 - \frac{1}{2} \int_{-2}^2 x^2 \cos\left(\frac{\pi}{2}ix\right) dx \\ &= \frac{2}{2\pi i} \int_{-2}^2 x^2 d\left(\sin\left(\frac{\pi}{2}ix\right)\right) \\ &= \frac{1}{\pi i} \left( x^2 \sin\left(\frac{\pi}{2}ix\right) \Big|_{-2}^2 - \int_{-2}^2 2x \sin\left(\frac{\pi}{2}ix\right) dx \right) \end{aligned}$$

$$\begin{aligned}
&= \frac{4}{(\pi i)^2} \int_{-2}^2 x d\left(\cos\left(\frac{\pi}{2}ix\right)\right) = \frac{4}{(\pi i)^2} \left( x \cos\left(\frac{\pi}{2}ix\right) \Big|_{-2}^2 - \int_{-2}^2 \cos\left(\frac{\pi}{2}ix\right) d(x) \right) \\
&= \frac{4}{(\pi i)^2} 4\cos(\pi i) = (-1)^i \frac{16}{(\pi i)^2} \\
b_i &= \frac{1}{2} \int_{-2}^2 f(x) \sin\left(\frac{\pi}{2}ix\right) dx \\
&= \frac{1}{2} \int_{-2}^2 (2-x^2) \sin\left(\frac{\pi}{2}ix\right) dx \\
&= \frac{1}{2} \int_{-2}^2 2\sin\left(\frac{\pi}{2}ix\right) dx - \frac{1}{2} \int_{-2}^2 x^2 \sin\left(\frac{\pi}{2}ix\right) dx = 0
\end{aligned}$$

The coefficients  $b_i$  are zero, because both functions are odd in symmetric integrating limits.

Hence

$$\begin{aligned}
f(x) &\sim 2 - x^2 \sim \frac{4}{3} + \sum_{i=1}^{\infty} \left( (-1)^i \frac{16}{(\pi i)^2} \cos\left(\frac{\pi}{2}ix\right) + 0 * \sin\left(\frac{\pi}{2}ix\right) \right) \\
&= \frac{4}{3} + \sum_{i=1}^{\infty} \left( (-1)^i \frac{16}{(\pi i)^2} \cos\left(\frac{\pi}{2}ix\right) \right) \\
&= \frac{4}{3} - \frac{16}{\pi^2} \cos\left(\frac{\pi}{2}x\right) + \frac{16}{4\pi^2} \cos(\pi x) - \frac{16}{9\pi^2} \cos\left(\frac{3\pi}{2}x\right) + \dots
\end{aligned}$$

**Answer:**  $f(x) \sim \frac{4}{3} - \frac{16}{\pi^2} \cos\left(\frac{\pi}{2}x\right) + \frac{16}{4\pi^2} \cos(\pi x) - \frac{16}{9\pi^2} \cos\left(\frac{3\pi}{2}x\right) + \dots$
