

### Answer on Question #59579 - Math - Calculus

#### Question

1. If  $\varphi = 2xz^4 - x^2y$ , find  $|\nabla \varphi|$

(a)  $\sqrt{93}$

(b)  $\sqrt{80}$

(c)  $\sqrt{12}$

(d)  $\sqrt{110}$

#### Solution

$$\begin{aligned}\nabla \varphi &= \frac{\partial \varphi}{\partial x} \vec{i} + \frac{\partial \varphi}{\partial y} \vec{j} + \frac{\partial \varphi}{\partial z} \vec{k} = \frac{\partial(2xz^4 - x^2y)}{\partial x} \vec{i} + \frac{\partial(2xz^4 - x^2y)}{\partial y} \vec{j} + \frac{\partial(2xz^4 - x^2y)}{\partial z} \vec{k} \\ &= (2z^4 - 2xy) \vec{i} - x^2 \vec{j} + 8xz^3 \vec{k}\end{aligned}$$

$$|\nabla \varphi| = \sqrt{(2z^4 - 2xy)^2 + x^4 + 64x^2z^6}$$

Answer:  $|\nabla \varphi| = \sqrt{(2z^4 - 2xy)^2 + x^4 + 64x^2z^6}$ .

#### Question

2. If  $\varphi(x,y,z) = 3x^2y - y^3z^2$ , find  $\nabla \varphi$  at point  $(1, -2, -1)$

(a)  $-12\vec{i} - 9\vec{j} - 16\vec{k}$

(b)  $\vec{i} - 3\vec{j} - \vec{k}$

(c)  $2\vec{i} - 5\vec{j} - 6\vec{k}$

(d)  $-3\vec{i} - 4\vec{j} - 2\vec{k}$

#### Solution

$$\begin{aligned}\nabla \varphi &= \frac{\partial \varphi}{\partial x} \vec{i} + \frac{\partial \varphi}{\partial y} \vec{j} + \frac{\partial \varphi}{\partial z} \vec{k} = \frac{\partial(3x^2y - y^3z^2)}{\partial x} \vec{i} + \frac{\partial(3x^2y - y^3z^2)}{\partial y} \vec{j} + \frac{\partial(3x^2y - y^3z^2)}{\partial z} \vec{k} = \\ &= 6xy \vec{i} + (3x^2 - 3y^2z^2) \vec{j} - 2zy^3 \vec{k}\end{aligned}$$

Then we put point's coordinates in the previous expression:

$$\begin{aligned}\nabla \varphi(1; -2; -1) &= 6 \cdot 1 \cdot (-2) \cdot \vec{i} + (3 \cdot 1^2 - 3 \cdot (-2)^2 \cdot (-1)^2) \vec{j} - 2 \cdot (-1) \cdot (-2)^3 \vec{k} = \\ &= -12\vec{i} - 9\vec{j} - 16\vec{k}\end{aligned}$$

Answer: (a)  $-12\vec{i} - 9\vec{j} - 16\vec{k}$ .

#### Question

3. Find a unit normal to the surface  $x^2y + 2xz = 4$  at point  $(2, -2, 3)$ :

(a)  $2/3\vec{i} - 2/3\vec{j} - 2/3\vec{k}$

(b)  $-1/5\vec{i} + 2/5\vec{j} + 2/5\vec{k}$

(c)  $-1/3\mathbf{i} + 2/3\mathbf{j} + 2/3\mathbf{k}$

(d)  $-1/7\mathbf{i} + 2/7\mathbf{j} + 2/7\mathbf{k}$

### Solution

First, we rewrite the surface equation in the form of  $F(x, y, z) = 0$ .

$$x^2y + 2xz - 4 = 0.$$

A normal to a surface can be found as  $\vec{F}'(A) = (F_x'(A); F_y'(A); F_z'(A))$ , where A is the point (2;-2;3).

$$F_x'(A) = 2xy + 2z = -2,$$

$$F_y'(A) = x^2 = 4,$$

$$F_z'(A) = 2x = 4,$$

$$|\vec{F}'(A)| = \sqrt{(-2)^2 + 4^2 + 4^2} = 6.$$

A unit normal vector is

$$\vec{n} = \frac{\vec{F}'(A)}{|\vec{F}'(A)|} = \frac{-2\vec{i} + 4\vec{j} + 4\vec{k}}{6} = -\frac{1}{3}\vec{i} + \frac{2}{3}\vec{j} + \frac{2}{3}\vec{k}.$$

**Answer:** (c)  $-1/3\mathbf{i} + 2/3\mathbf{j} + 2/3\mathbf{k}$ .

### Question

4. Let  $\varphi(x,y,z)=xy^2z$  and  $A=xzi-xy^2j+yz^2k$ , find  $\partial^3/\partial x^2\partial z(\varphi A)$

(a)  $2\mathbf{i} + 2\mathbf{j} - 5\mathbf{k}$

(b)  $5\mathbf{i} - \mathbf{k}$

(c)  $4\mathbf{i} - 2\mathbf{j}$

(d)  $\mathbf{i} + \mathbf{j}$

### Solution

$$(\varphi A) = xy^2z \cdot (xz; -xy^2; yz^2) = (x^2y^2z^2; -x^2y^4z; xy^3z^3)$$

$$\frac{\partial^3}{\partial x^2 \partial z} (x^2y^2z^2) = \frac{\partial^2}{\partial x^2} \left( \frac{\partial}{\partial z} (x^2y^2z^2) \right) = \frac{\partial^2}{\partial x^2} (2x^2y^2z) = 4y^2z$$

$$\frac{\partial^3}{\partial x^2 \partial z} (-x^2y^4z) = \frac{\partial^2}{\partial x^2} (-x^2y^4) = -2y^4$$

$$\frac{\partial^3}{\partial x^2 \partial z} (xy^3z^3) = \frac{\partial^2}{\partial x^2} (3xy^3z^2) = 0.$$

Thus,

$$\frac{\partial^3}{\partial x^2 \partial z} (\varphi \vec{A}) = 4y^2z \vec{i} - 2y^4 \vec{j}.$$

If we need answer with only numbers we need to choose the point where we calculate  $\frac{\partial^3}{\partial x^2 \partial z} (\phi \vec{A})$ .

Also we can see that answers **2i+2j-5k** and **5i-k** are false, because k-th component of the vector  $\frac{\partial^3}{\partial x^2 \partial z} (\phi \vec{A})$  is zero. And the answer **i+j** is false because j-th component of the vector  $\frac{\partial^3}{\partial x^2 \partial z} (\phi \vec{A})$  is always less or equal than zero:

$$-2y^4 \leq 0.$$

So, only **4i-2j** can be answer to the problem.

**Answer: (c) 4i-2j.**

### Question

5. Given that  $\varphi=2x^2y-xz^3$  find  $\nabla^2\varphi$

(a)  $2y-6xz$

(b)  $4y-6xz$

(c)  $2y-xz$

(d)  $y+6xz$

### Solution

$$\begin{aligned}\nabla\varphi &= \frac{\partial\phi}{\partial x}\vec{i} + \frac{\partial\phi}{\partial y}\vec{j} + \frac{\partial\phi}{\partial z}\vec{k} = \frac{\partial(2x^2y - xz^3)}{\partial x}\vec{i} + \frac{\partial(2x^2y - xz^3)}{\partial y}\vec{j} + \frac{\partial(2x^2y - xz^3)}{\partial z}\vec{k} = \\ &= (4xy - z^3)\vec{i} + 2x^2\vec{j} - 3xz^2\vec{k},\end{aligned}$$

$$\begin{aligned}\nabla^2\varphi &= \frac{\partial^2\phi}{\partial x^2} + \frac{\partial^2\phi}{\partial y^2} + \frac{\partial^2\phi}{\partial z^2} = \frac{\partial^2(2x^2y - xz^3)}{\partial x^2} + \frac{\partial^2(2x^2y - xz^3)}{\partial y^2} + \frac{\partial^2(2x^2y - xz^3)}{\partial z^2} = \\ &= \frac{\partial}{\partial x}\frac{\partial}{\partial x}(2x^2y - xz^3) + \frac{\partial}{\partial y}\frac{\partial}{\partial y}(2x^2y - xz^3) + \frac{\partial}{\partial z}\frac{\partial}{\partial z}(2x^2y - xz^3) = \\ &= \frac{\partial}{\partial x}(4xy - z^3) + \frac{\partial}{\partial y}(2x^2) + \frac{\partial}{\partial z}(-3xz^2) = 4y + 0 + (-6xz) = 4y - 6xz.\end{aligned}$$

**Answer: (b) 4y-6xz.**
