

## Answer on Question #60649 – Math – Statistics and Probability

### Question

a) Let the random variable X have the following distribution:

$$P(X=0) = P(X=2) = p$$

$$P(X=1) = 1 - 2p, \text{ where } 0 \leq p \leq 1.$$

for what value of p is the var(X) a maximum? Justify.

### Solution

$$\begin{aligned} \text{Var}(X) &= M(X^2) - (M(X))^2 = \sum_{i=1}^3 x_i^2 p_i - \left( \sum_{i=1}^3 x_i p_i \right)^2 = \\ &= (0^2 \cdot p + 1^2 \cdot (1 - 2p) + 2^2 \cdot p) - (0 \cdot p + 1 \cdot (1 - 2p) + 2 \cdot p)^2 \\ &= 1 - 2p + 4p - 1 = 2p \end{aligned}$$

$$\max \text{Var}(X) = \max \left\{ 2p, 0 \leq p \leq \frac{1}{2} \right\} = 1$$

VarX is maximum for  $p = \frac{1}{2}$ .

### Question

b) In a binomial distribution consisting of 5 independent trials, probabilities of 1 and 2 successes are 0.4096 and 0.2048 respectively. Find the parameter 'p' of the distribution.

### Solution

For a binomial distribution, the probability of X successes in n trials is given by

$$\binom{n}{x} p^x q^{n-x}.$$

Probability of one success in 5 independent trials is

$$\binom{5}{1} p q^4 = 0.4096.$$

Probability of two successes in 5 independent trials is

$$\binom{5}{2} p^2 q^3 = 0.2048.$$

Now find:

$$\frac{\binom{5}{1} p q^4}{\binom{5}{2} p^2 q^3} = \frac{0.4096}{0.2048}$$

$$\frac{5q}{10p} = 2$$

On the other hand,

$$p + q = 1$$

Then

$$4p = q = 1 - p \rightarrow 4p + p = 1 \rightarrow 5p = 1 \rightarrow p = \frac{1}{5}$$

**Answer:** 0.200.

### Question

c) Fit a Poisson distribution to the following data:

$x_i$	0	1	2	3	4
$p_i$	$\frac{109}{200}$	$\frac{65}{200}$	$\frac{22}{200}$	$\frac{3}{200}$	$\frac{1}{200}$

### Solution

Calculating the mean and variance:

$$E(N) = (M(X)) = \sum_{i=1}^5 x_i p_i = \frac{1}{200} (0 \cdot 109 + 1 \cdot 65 + 2 \cdot 22 + 3 \cdot 3 + 4 \cdot 1) = 0.61$$

$$\begin{aligned} \text{Var}(X) &= M(X^2) - (M(X))^2 = \sum_{i=1}^5 x_i^2 p_i - \left( \sum_{i=1}^5 x_i p_i \right)^2 \\ &= \frac{1}{200} (0^2 \cdot 109 + 1^2 \cdot 65 + 2^2 \cdot 22 + 3^2 \cdot 3 + 4^2 \cdot 1) - 0.61^2 = 0.98 - 0.37 \\ &= 0.61 \end{aligned}$$

Since  $E(N) = \text{Var}(X)$ , this can be modeled as a Poisson distribution because in this distribution

$E(N) = \text{Var}(X) = \lambda$ , and here we can assign  $\lambda = 0.61$ :

$$\Pr(N = k) = \frac{\lambda^k}{k!} e^{-\lambda} = \frac{0.61^k}{k!} e^{-0.61}, \text{ for } k \geq 0.$$
