Answer on Question #62313 – Math – Algebra

Question

The method of locating points on a Cartesian plane is known as?

Solution

The method to determine the position of the points on the coordinate system called the **method of coordinates**. The position of a point on the Cartesian plane is described by the ordered pair (x, y), where *x* is called the *x*-coordinate and *y* is called the *y*-coordinate.

Solution of problems by the method of coordinates:
1) build the Cartesian coordinate system;
2) find the coordinates of the points;
3) defined by the distance between the points, deduce equations;
4) analyze the equation.
