## Answer on Question \#64476 - Math - Calculus

## Question

The relationship of a capacitor voltage (volts) and time (seconds) is given by $V=95\left(1-e^{0.1 t}\right)$.

1. Plot the graph between $t=0$ and $t=50$ at 10 intervals.
2. Find the differentiation value at $t=10$. Use calculus to verify your solution.

## Solution

1. 

| t, sec | 0 | 5 | 10 | 15 | 20 | 25 | 30 | 35 | 40 | 45 | 50 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| U, <br> volts | 0 | -61.63 | -163.24 | -330.76 | -606.96 | -1062.34 | -1813.13 | -3050.97 | -5091.82 | -8456.63 | -14004.25 |

2. To differentiate $V=95\left(1-e^{0.1 t}\right)$, we need to use the following rules:

1. $f^{\prime}(a x)=a f^{\prime}(x)$;
2. $(f(x) \pm g(x))^{\prime}=f^{\prime}(x) \pm g^{\prime}(x)$;
3. $(f(g(x)))^{\prime}=f^{\prime}(g(x)) \cdot g^{\prime}(x)$;

Therefore,

$$
V^{\prime}(t)=\left(95\left(1-e^{0.1 t}\right)\right)^{\prime}=95 \cdot\left(1-e^{0.1 t}\right)^{\prime}=95 \cdot\left(0-\left(e^{0.1 t}\right)^{\prime}\right)=-95 e^{0.1 t} \cdot 0.1=-9.5 e^{0.1 t}
$$

Thus, at $t=10$

$$
V^{\prime}(10)=-9.5 e^{0.1 \cdot 10}=-9.5 e=-25.82 .
$$
