

Answer on Question #69629 – Math – Differential Equations

Question

Solve the initial value problem $(1 + y^2)dx + (1 + x^2)dy = 0, y(0) = -1$.

Solution

$$(1 + y^2)dx + (1 + x^2)dy = 0, \quad (1)$$
$$y(0) = -1.$$

The equation (1) is separable because dividing (1) by $(1 + y^2)(1 + x^2)$ the variables can be separated:

$$\frac{dx}{1+x^2} + \frac{dy}{1+y^2} = 0,$$
$$\frac{dy}{1+y^2} = -\frac{dx}{1+x^2}.$$

Integrating both sides we get

$$\int \frac{dy}{1+y^2} = \int -\frac{dx}{1+x^2},$$
$$\tan^{-1} y = -\tan^{-1} x + C.$$

When $x = 0, y(0) = -1$:

$$\begin{aligned}\tan^{-1}(-1) &= -\tan^{-1}(0) + C, \\ -\frac{\pi}{4} &= 0 + C, \\ C &= -\frac{\pi}{4}, \\ \tan^{-1} y &= -\tan^{-1} x - \frac{\pi}{4}. \end{aligned} \quad (2)$$

Take the tangent of both sides of equality (2):

$$\begin{aligned}\tan(\tan^{-1} y) &= \tan\left(-\tan^{-1} x - \frac{\pi}{4}\right), \\ y &= -\tan\left(\tan^{-1} x + \frac{\pi}{4}\right), \\ y &= -\frac{\tan(\tan^{-1} x) + \tan\left(\frac{\pi}{4}\right)}{1 - \tan(\tan^{-1} x) \cdot \tan\left(\frac{\pi}{4}\right)}, \\ y &= -\frac{x+1}{1-x}, \\ y &= \frac{x+1}{x-1}. \end{aligned}$$

Answer: $y = \frac{x+1}{x-1}$.
