

Answer on Question #76441 – Math – Calculus

Question

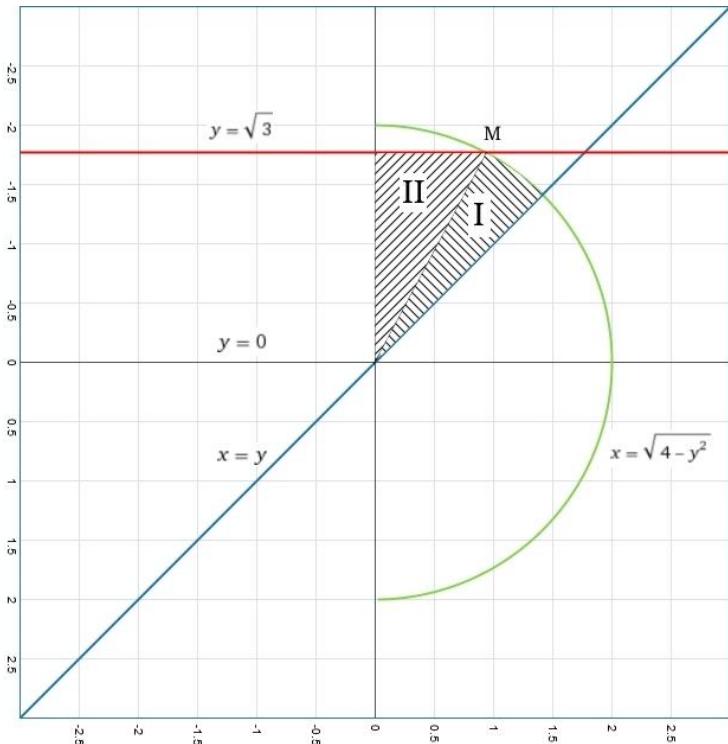

Evaluate the integral by converting to polar coordinates

$$\int_0^{\sqrt{3}} \int_y^{\sqrt{4-y^2}} \frac{dxdy}{4+x^2+y^2};$$

Solution

Double Integrals in Polar Coordinates:

$$\iint_D f(x, y) dxdy = \iint_{\Omega} f(r \cos \phi, r \sin \phi) r dr d\phi;$$

Intersection point M:

$$y = \sqrt{3};$$

$$2 \sin \phi = \sqrt{3}; \quad \phi = \frac{\pi}{3}.$$

We have two areas:

$$\text{I: } 0 \leq r \leq 2; \quad \frac{\pi}{4} \leq \phi \leq \frac{\pi}{3};$$

$$\text{II: } 0 \leq r \leq \frac{\sqrt{3}}{\sin \phi}; \quad \frac{\pi}{3} \leq \phi \leq \frac{\pi}{2};$$

$$4 + x^2 + y^2 = 4 + (r \sin \phi)^2 + (r \cos \phi)^2 \\ = 4 + r^2.$$

$$\begin{aligned} \int_0^{\sqrt{3}} \int_y^{\sqrt{4-y^2}} \frac{dxdy}{4+x^2+y^2} &= \int_{\pi/4}^{\pi/3} d\phi \int_0^2 \frac{rdr}{4+r^2} + \int_{\pi/3}^{\pi/2} d\phi \int_0^{\frac{\sqrt{3}}{\sin \phi}} \frac{rdr}{4+r^2} = \left(\frac{\pi}{3} - \frac{\pi}{4}\right) \frac{1}{2} \int_0^2 \frac{d(4+r^2)}{4+r^2} + \int_{\pi/3}^{\pi/2} d\phi \int_0^{\frac{\sqrt{3}}{\sin \phi}} \frac{d(4+r^2)}{4+r^2} \\ &= \frac{\pi}{24} [\ln(4+r^2)]_0^2 + \int_{\pi/3}^{\pi/2} d\phi [\ln(4+r^2)]_0^{\sqrt{3}/\sin \phi} \\ &= \frac{\pi}{24} (\ln 8 - \ln 4) + \int_{\pi/3}^{\pi/2} d\phi \left[\ln \left(4 + \frac{3}{(\sin \phi)^2} \right) - \ln 4 \right] = \frac{\pi \ln 2}{24} + \int_{\pi/3}^{\pi/2} d\phi \ln \left(1 + \frac{3}{4(\sin \phi)^2} \right). \end{aligned}$$

Last integral is not defined by the elementary functions; its circled value is 0.315155.

Answer: $I = \frac{\pi \ln 2}{24} + 0.315155.$
