

Answer of question #77916, Physics - Mechanics - Relativity

A particle is projected from rest from the top of a vertical tower. In the final 2 seconds it moves a distance $\frac{3}{4}$ th the height of the tower. Find the height of the tower. ($g = 10 \text{ ms}^{-2}$)

Input Data:

$\frac{dh}{H} = \frac{3}{4}$, where dh is the distance traveled in the last 2 seconds, and h is the height of the tower

$$g = 10 \frac{m}{s^2}$$

Solution:

Let the tower height be:

$$H = \frac{gt^2}{2};$$

The distance that the body will pass without the last 2 seconds:

$$h = \frac{g(t-2)^2}{2};$$

Then the distance traveled by the body in the last 2 seconds is equal to:

$$dh = H - h;$$

$$\frac{dh}{H} = \frac{H-h}{H} = 1 - \frac{h}{H} = \frac{3}{4};$$

$$\frac{h}{H} = \frac{1}{4} ; H = 4h;$$

Substituting the values, we obtain the quadratic equation:

$$\frac{gt^2}{2} = \frac{4g(t-2)^2}{2};$$

$$3t^2 - 16t + 16 = 0$$

Solving the equation, we get the time of falling from the tower:

$$t=4s;$$

Whence the height of the tower is:

$$h = \frac{10 * 4^2}{2} = 80m$$

Answer:

Height of the tower is 80m
